Importance: +P+P+P

Sub Topics

+P Topics:
• Factors affecting evaporation

+P+P Topics:
• Examples of evaporation

+P+P+P Topics:
• Definition and process of evaporation

Notes

Evaporation

- Definition: Change of water from liquid to gas state at temperature below boiling point.
- Process: Heat gives energy to water molecules !’ molecules move faster !’ some escape from surface !’ become water vapor.
- Key Points:
  - Occurs at any temperature.
  - Requires heat, surface area, and wind.
  - Leaves behind salts and impurities.
- Examples: Drying of wet clothes, puddles disappearing after rain, water in a pot left uncovered.

Revision Points

• Evaporation is liquid to gas change below boiling point.
• Heat gives energy to water molecules to escape.
• Occurs at any temperature.
• Factors: heat, surface area, wind.
• Leaves salts behind.
• Examples: drying clothes, puddles, open pot.

Important Questions

Short Questions:
• What is evaporation?
• Name two factors that increase the rate of evaporation.

Long Questions:
• Explain how heat and wind affect the rate of evaporation with examples.
• Describe the process of evaporation and its importance in the water cycle.

Diagram Question:

Draw a flowchart to show the steps involved in evaporation.
